Mr. Tim Rehder
Rocky Flats Project Manager
U.S. Environmental Protection Agency, Region VIII
999 18th Street, Suite 500, 8EPR-F
Denver, Colorado 80202-2466

Dear Mr. Rehder:

Enclosed please find the *Quarterly Report for the Mound Site Plume Treatment Project* for your information. This report covers the activity and available data for the quarter from January 1, 1999 through March 31, 1999. There are no safety issues for this reporting period.

If you should have any questions related to this report, please contact Norma I. Castaneda at (303) 966-4226 or contact me at (303) 966-5918.

Sincerely,

Joseph A. Legate
Assistant Manager
for Environment and Infrastructure

**QUARTERLY REPORT
FOR THE
MOUND SITE PLUME TREATMENT PROJECT**

January Through March 1999

March 30, 1999

INTRODUCTION

The Mound Site Plume Treatment System collects and treats the contaminated groundwater plume derived from the Mound Site to the Groundwater Action Level Framework Tier II level concentrations defined in the Rocky Flats Cleanup Agreement (RFCA) (DOE, 1996), and demonstrates the feasibility of using this system on other contaminated groundwater plumes. The components of the Mound Site Plume System are shown on Figure 1.

The Mound Site Plume Treatment Project was a cooperative effort between RFETS and the Department of Energy Subsurface Contaminant Focus Area (EM-50), with support from the US Environmental Protection Agency (EPA) SITE Program. The Mound Site Plume Treatment Project employs innovative technology for the collection and treatment of contaminated groundwater containing chlorinated organic contamination and low levels of radionuclides.

This report covers the activity and available data for the quarter from January 1, 1999 to March 31, 1999. Included in this report are the analytical results for samples collected in the previous quarter, but which were not available in time to be included in the last quarterly report. There are no safety issues for this reporting period.

PROJECT EVENTS

Raking of the iron in the two treatment cells continues along with water level monitoring, and sample collection by the EPA SITE Program (performed by TetraTech). Each of the two treatment cells contains 8 feet of iron filings that act as the treatment medium for the contaminated water. The surface of the iron filings requires regular raking to prevent formation of a crust. The crust continues to form and requires mechanical disruption in Reactor Cell 1. No crust has been observed in Reactor Cell 2. The piezometers for monitoring upgradient and downgradient water levels were installed during this quarter. Installation of these 7 piezometers was completed on January 7, 1999.

TREATMENT EFFECTIVENESS

Flow rates from the treatment system for the December-March period are shown on Figure 2. The higher flow rates in late December correspond to a storm event; the steadily increasing flow rates correspond to the beginning of the wet season.

Water levels within the collection trench are monitored by 5 piezometers (P1 through P5). Locations are shown on Figure 1 with the results shown in Table 1. These data indicate that the east side of the collection trench is dry, as was anticipated. This side of the plume was believed to be dry prior to installation of the collection system. Water levels from the piezometers up- and downgradient of the collection trench were measured weekly for the first month, and are now measured monthly. These results are also shown in Table 1.

The total flow volume through the system as of March 26, 1999 was 55,102 gallons of water. The average flow rate for January through March was 0.28 gallons per minute.

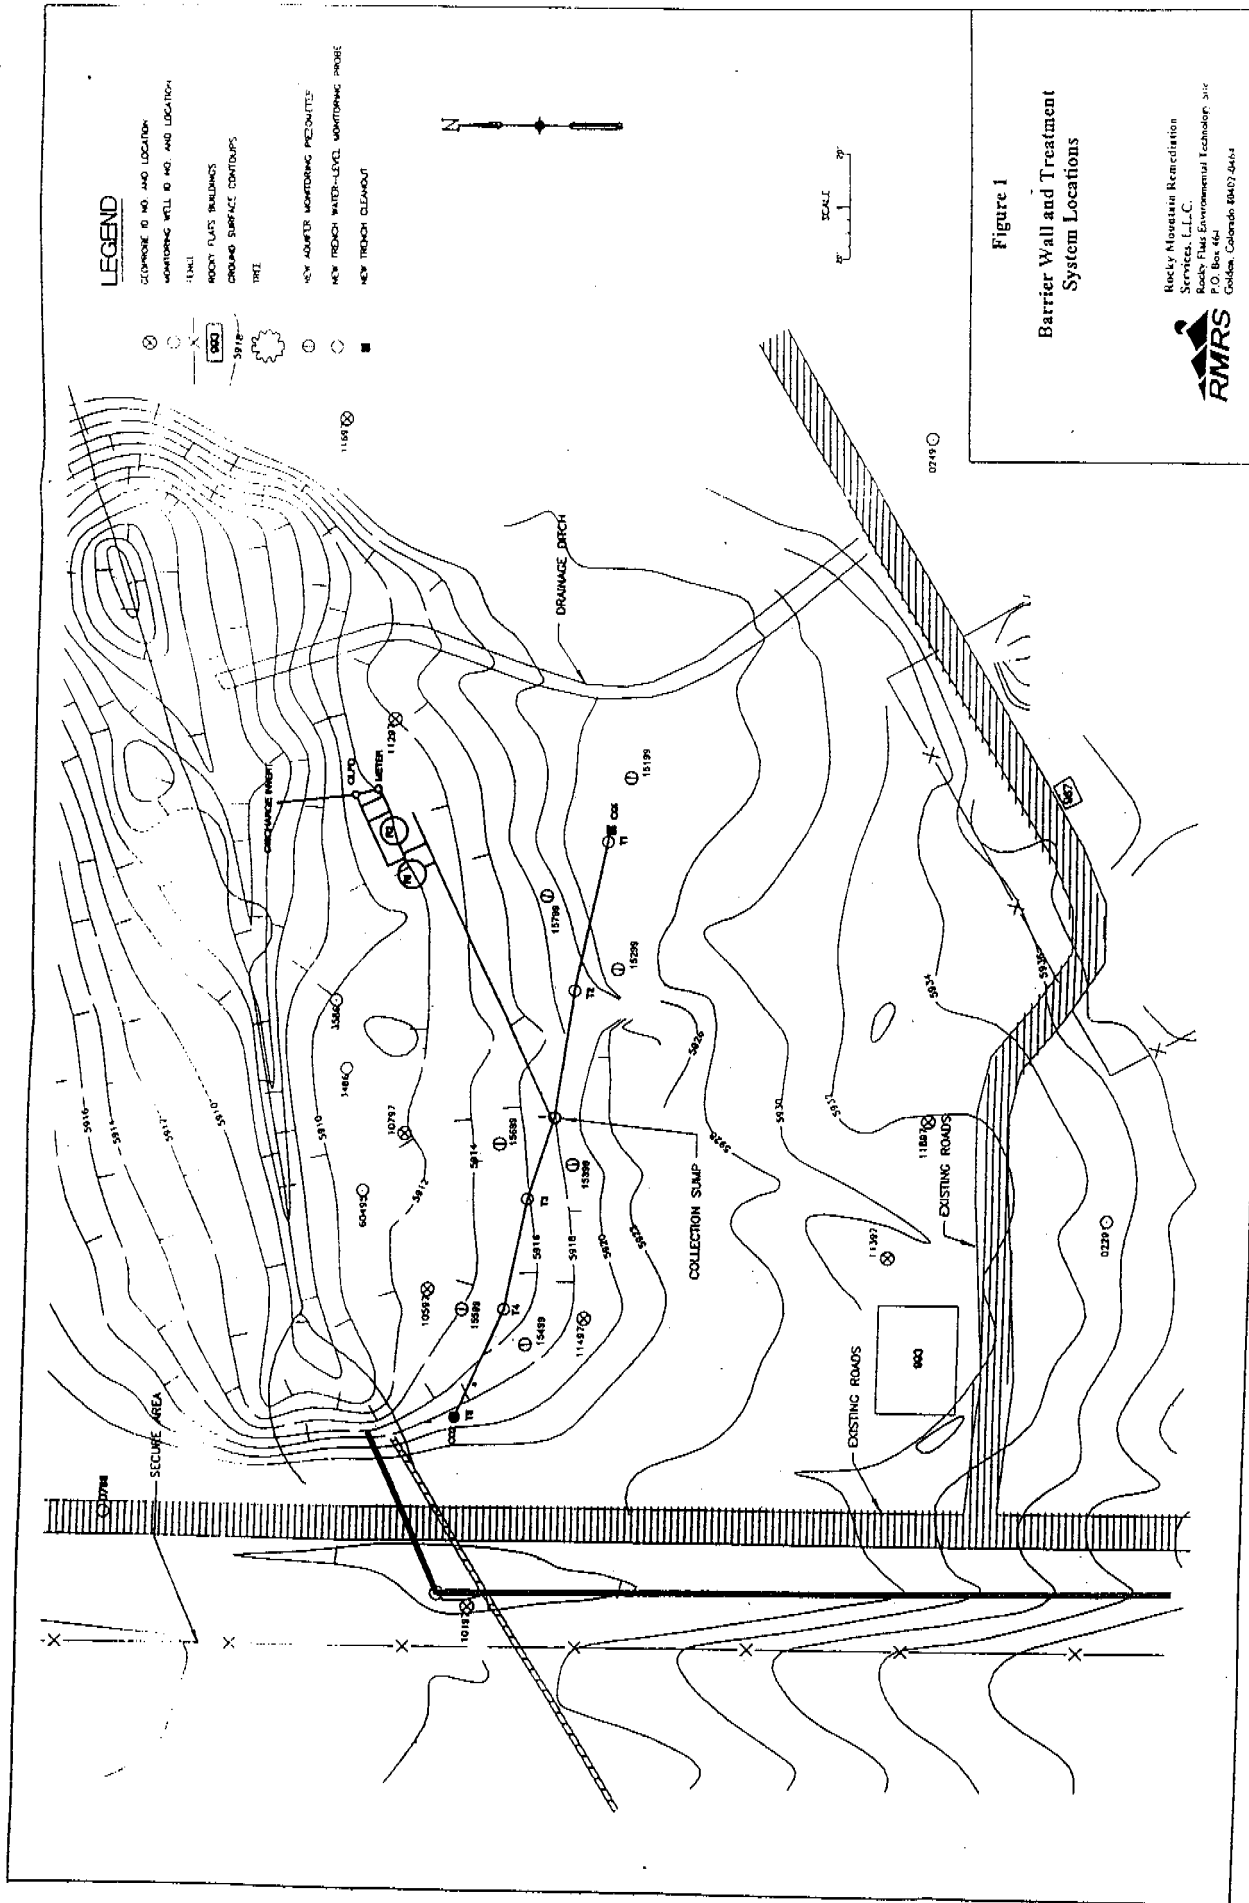

Figure 2. Mound Plume Treatment System Flow Rates

NM = Not measured

Samples were collected twice in December, 1998, and once per month for a total of four sampling events as of March 1999. Four sets of sample results were received this quarter and are provided in Appendix A. As of the report date, the data has not been verified or validated and a data quality assessment has not been conducted. Three sets of influent samples were collected for later statistical analysis. The first sample collected from each set is used for the following summaries. The results indicate that the volatile organic compounds (VOCs) are being removed within the first foot of reactive iron, with concentrations of trichloroethene, tetrachloroethene, and carbon tetrachloride showing significant decrease from the influent sample port to the first sample port. Concentrations of VOCs are low to non-detect in samples collected from the second, third, and fourth sample ports. Figure 3 shows the sampling locations within the treatment cells.

December 10, 1998 Sampling Event: Contaminants of concern include carbon tetrachloride, chloroform, cis 1,2-dichloroethene, tetrachloroethene, 1,1,1-trichloroethane, trichloroethene, and methylene chloride. Samples collected at the effluent from the first treatment cell show that all of these VOCs were reduced to levels below the RFCA Tier II Groundwater Action Levels at this location (see Table 2 and Figure 4).

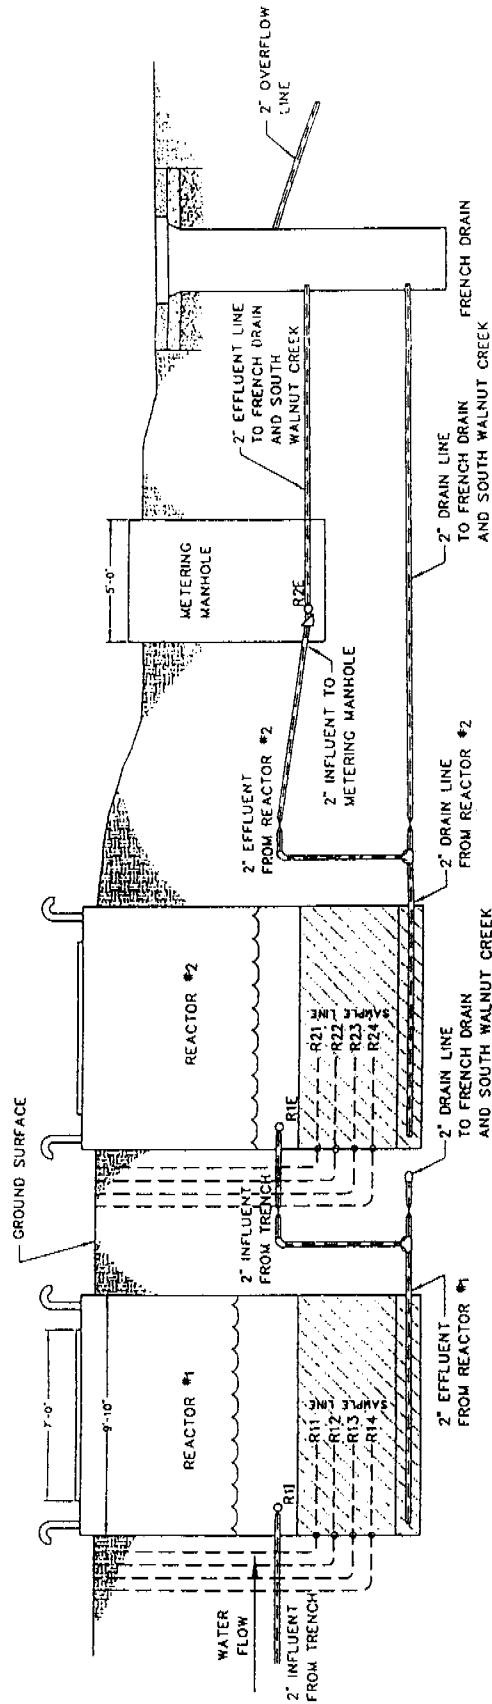

Table 2. Summary of the December 10, 1998 Sampling Event

Contaminant	Average Influent Conc. (ug/l)	Effluent from Reactor 1 Concentrations (ug/l)	RFCA Groundwater Tier II Action levels (ug/l)
Carbon Tetrachloride	39.5	ND	5
Chloroform	16	1.7	100
cis 1,2-dichloroethene	25	1.8	70
Tetrachloroethene	34.5	0.25 J	5
1,1,1-Trichloroethane	3.6	ND	200
Trichloroethene	65	0.39 J	5
Methylene Chloride	1.3	2.7 J	5
Total Uranium	<MDA	0.552	10 pCi/l

ND = Not detected at the detection limit for this analysis

J = Detected below detection limit for analysis

<MDA = Below the minimum detectable activity

Figure 5

MOUND PLUME TREATMENT RESULTS By Sample Locations--12/29/98-12/30/98

December 29-30, 1998 Sampling Event: All VOCs were reduced below the RFCA Groundwater Tier II Action Levels as shown below in Table 3 and on Figure 5.

Table 3. Summary of the December 29-30, 1998 Sampling Event

Contaminant	Average Influent Conc. (ug/l)	Effluent from Reactor 1 Concentrations (ug/l)	RFCA Groundwater Tier II Action levels (ug/l)
Carbon Tetrachloride	49.3	ND	5
Chloroform	7.4	13	100
cis 1,2-dichloroethene	5.6	7.1	70
Tetrachloroethene	17.3	0.28 J	5
1,1,1-Trichloroethane	3.5	ND	200
Trichloroethene	19.3	0.51 J	5
Total Uranium	9.5 pCi/l	<MDA	10 pCi/l

ND = Not detected at the detection limit for this analysis

J = Detected below detection limit for analysis

<MDA = Below the minimum detectable activity

January 27, 1999 Sampling Event: All VOCs were reduced below the Groundwater Tier II Action Levels, as shown below in Table 4 and on Figure 6. However the effluent sample showed an increase from the influent concentration for methylene chloride and acetone. Acetone is a common lab contaminant, has not been encountered anywhere else in the system and is unlikely to be a treatment reaction product. Methylene chloride is found in the influent, but at a lower amount than within the effluent. Methylene chloride is also a common lab contaminant, but it also might be due to a reaction within the treatment system. Regardless of the origin, the concentrations are below action levels. It is assumed that because these are common solvents used in analytical laboratories, the levels detected are a result of cross contamination within the analytical testing lab.

Table 4. Summary of the January 27, 1999 Sampling Event

Contaminant	Average Influent Conc. (ug/l)	Effluent from Reactor 1 Concentrations (ug/l)	RFCA Groundwater Tier II Action levels (ug/l)
Carbon Tetrachloride	42	ND	5
Chloroform	12.7	0.66	100
cis 1,2-dichloroethene	22	2.6	70
Tetrachloroethene	28	ND	5
1,1,1-Trichloroethane	3.8	ND	200
Trichloroethene	57	ND	5
Methylene Chloride	0.61 J	1.8 J	5
Acetone	ND	4.2 J	3,650
Total Uranium	13.4 pCi/l	0.132 pCi/l	10 pCi/l

ND = Not detected at the detection limit for this analysis

J = Detected below detection limit for analysis

B = Contaminant also detected in analytical lab blank, indicating possible lab contamination.

February 23, 1999 Sampling Event: All VOCs were reduced below the Groundwater Tier II Action Levels, as shown below in Table 5 and on Figure 7. However the influent sample contained acetone and methylene chloride and these were also detected in the blank sample run by the analytical lab. While the effluent sample also showed an increase from the influent concentration for methylene chloride, both acetone and methylene chloride were also detected in the blank sample run by the lab for the effluent samples. These contaminant concentrations are below action levels, and are most likely to be from contamination within the analytical testing lab.

Figure 7

MOUND PLUME TREATMENT RESULTS By Sample Locations--2/23/99

Table 5. Summary of the February 23, 1999 Sampling Event

Contaminant	Average Influent Conc. (ug/l)	Effluent from Reactor 1 Concentrations (ug/l)	RFCA Groundwater Tier II Action levels (ug/l)
Carbon Tetrachloride	54	ND	5
Chloroform	15	1.4	100
cis 1,2-dichloroethene	28	4.0	70
Tetrachloroethene	47	ND	5
1,1,1-Trichloroethane	4.9	ND	200
Trichloroethene	83	ND	5
Methylene Chloride	1.5 JB	4.7 JB	5
Acetone	12 JB	1.4 JB	3,650

ND = Not detected at the detection limit for this analysis

J = Detected below detection limit for analysis

CONCLUSIONS

The Mound Site Plume Treatment Project is fully operational and treating contaminated groundwater to below the specified system performance requirements. Ongoing maintenance, raking the iron filings and retrieving flow rate and water level data, are the only required activities. Sampling will continue at regular intervals to verify the performance of the treatment system. For the next quarter, April through June 1999, no changes in the system are expected.
